

**A 54-year-old African American female presents to your clinic for an initial exam. She has a history of hypertension controlled with beta-blockers but no other contributory health findings. Your **intra-oral** exam reveals a bilateral filmy opalescence of the buccal mucosa. When stretching out her cheeks, this white hue disappears. Your most likely diagnosis is:**

- Squamous cell carcinoma
- Fordyce granulation
- Leukoedema
- Leukoplakia
